

Organizational Trust Quotient

Speaker Notes — Capstone Presentation

Vernon T. Cox · Srilatha Alla

Presenter split: Both — slides 1 & 17 · Vernon — slides 2–6 and 13–16 · Srilatha — slides 7–12

Plain-language talking points — a short numbered list per slide, restarting at 1 each slide. These match the notes embedded in the PowerPoint file. Speak them in order, or skim; trim or expand to taste.

Slide 1 · Reading team health from everyday messages

Speaker: **Vernon & Srilatha**

1. Welcome — I'm Vernon Cox, with my co-researcher Srilatha Alla.
2. We built the Organizational Trust Quotient, or OTQ.
3. The idea: how a team talks day to day — how often they message, how fast they reply — signals how the team is doing.
4. We don't survey anyone and we never read messages; we use patterns that are already there.
5. Today I'll cover the problem, what we measure, the data, and the working tool we built.

Slide 2 · Preview - What we'll cover

Speaker: **Vernon**

1. Here's the quick roadmap for the next ten minutes.
2. First, the problem — why this is harder than it sounds.
3. Then what OTQ looks at, and the data behind it.
4. Then the results and the website we built.
5. Finally, the takeaways and where we'd go next.
6. I'll keep it plain — no data degree required.

Slide 3 · The Business Problem

Speaker: **Vernon**

1. Let's start with why this matters in dollars.
2. Unfocused — everyone's busy, but pulling in different directions.
3. Disjointed — work happens in silos; things get duplicated or dropped between people.
4. Unheard — concerns surface too late, after they've become real problems.
5. None of these show on a balance sheet, but all of them burn hours, slow projects, and push good people out.
6. That's real money — leaders just rarely see it until it's late.

Slide 4 · The Problem - Trust is hard to see

Speaker: **Vernon**

1. How do companies check on this today? Mostly surveys — annual, quarterly, pulse.
2. Surveys only happen now and then, so problems get spotted months late.
3. People tend to answer how they think they're supposed to.
4. And they pull everyone away from real work to fill them out.
5. Meanwhile, teams send thousands of messages a day — a signal that goes unused.
6. Our goal: an always-on read, with no extra work for anyone.

Slide 5 · What OTQ Looks At

Speaker: **Vernon**

1. Here's the heart of it — and I'll be straight about each step.
2. We measure engagement — how much a team talks and meets.
3. From that, we predict responsiveness — how fast they reply.
4. What we're really curious about underneath is trust.
5. The honest part: we measure talk and predict replies; trust is what we believe sits underneath.
6. We do NOT claim to measure trust directly — and we keep that front and center.

Slide 6 · The Data - Where it comes from

Speaker: **Vernon**

1. The data comes from three tools every office already uses.
2. Slack for chats, Teams for meetings, Outlook for calendar invites.
3. We combine them into one table — here, about 1,250 events.
4. No real company yet, so we built safe stand-in data using apostle names.
5. It has the same shape as real exports — so the code is ready for the real thing.

Slide 7 · The Data - What's in it

Speaker: **Srilatha**

1. Each row is one interaction — counts and timing, never the words.
2. We keep who and where, how long, how many people, and a reply-speed clue.
3. That's it — no message content, ever.
4. About 1,250 events, three sources, roughly eight simple facts each.
5. Privacy is built in from the start, not bolted on.

Slide 8 · The Data - How we score it

Speaker: **Srilatha**

1. We turn each interaction into a score — think of it as engagement points.
2. A meeting counts more than a quick email, because it takes more from people.
3. Longer counts more than shorter; more people counts more than fewer.
4. Each day, we add it all up — total score, number of events, average length and size.
5. Busy days score high, quiet days score low — and anyone can follow the rule.

Slide 9 • Under the Hood - The code

Speaker: **Srilatha**

1. For the technical folks: the actual code — but you don't need to read it.
2. The top function is the rule I just described: type, plus duration, plus how many people.
3. The bottom is where we feed those daily numbers into the model.
4. The point: the plain-English idea and the code line up — nothing hidden.

Slide 10 • The Data - A first look

Speaker: **Srilatha**

1. Before modeling, we always look at the data.
2. Simplest view: how many people are in each interaction.
3. The big spike on the left — most interactions are just two people.
4. The tail to the right — the bigger group meetings.
5. Nothing surprising, which is exactly what you want.

Slide 11 • The Model

Speaker: **Srilatha**

1. The model learns the link between engagement and reply speed.
2. Our clues overlap — busy days are busy all around — so it has to stay steady.
3. We used ridge regression: stable and easy to read.
4. We checked it — compared other models, tuned carefully, tested on days it never saw.
5. We also ranked which clues matter most — we didn't just trust the first thing that worked.

Slide 12 • What We Built

Speaker: **Srilatha**

1. This isn't just a notebook — it's a real website that runs the whole thing.
2. We connect to your data source first.
3. Then OTQ delivers your team's predictions, day by day.
4. You don't touch code — it runs everything and shows results and charts.
5. The whole pipeline, wrapped in something anyone can use.

Slide 13 • Stage Diagnosis - Full breakdown

Speaker: **Vernon**

1. We also checked whether the patterns line up with known team-development models.
2. This breaks down and ranks every stage on two well-known frameworks.
3. Caveat: it's an engagement-based indicator meant to spark discussion.
4. It is NOT a validated diagnosis of team development or culture.
5. We show the full ranking so it's transparent, not a black box.

Slide 14 • Beyond Responsiveness - Stage signal

Speaker: **Vernon**

1. Here's the same idea as a picture.
2. We map the engagement patterns onto two team-stage frameworks — Tuckman and Logan.
3. The bars show where the team leans on each one.
4. Same honesty: an indicative signal to discuss, not a clinical or validated assessment.
5. It's a conversation starter — here's what the patterns suggest; does it ring true?

Slide 15 • The Verdict

Speaker: **Vernon**

1. Here's the read in one view.
2. The top stage on each track, with a confidence score.
3. Plus the evidence: about 1,250 events, 184 people, over roughly six months.
4. So you get the headline and the proof together.
5. Again: an engagement-based indicator, not a clinical assessment — good for discussion, not a verdict to act on blindly.

Slide 16 • Take-Home Points

Speaker: **Vernon**

1. Four things to remember.
2. Always-on beats once a year — a live read beats an annual survey.
3. Talk predicts replies — more engaged teams answer faster.
4. We're honest about the limits — we measure talk, not trust itself, yet.
5. Private by design — counts and timing only, never message content.

Slide 17 • What's Next

Speaker: **Vernon & Srilatha**

1. Where we'd take this next.
2. Check our score against a trusted, established trust survey.
3. Run it on a real company's data.
4. Give each team and each person their own score.
5. Tie it to real outcomes — deadlines hit, tickets closed.
6. That's how we move from a promising signal to a proven tool. Thank you — happy to take questions.
